REVISION HISTORY

Version	Date	Author	Change
0.1	2026-10-31	Amish Chadha	First market and viability note at the kit 1.9.1 upgrade; prices and benchmarks checked 2026-10-31; no competitor station price is published, so those entries are to assess

DockHub market and viability

DockHub is for delivery-worker groups, courier and cargo-trike fleets, and cities that want a safe alternative to charging packs at home. Commercial swap networks prove demand: New York City's Department of Transportation (DOT) announced a citywide public network of 25 flagship sites on 2025-11-18, with first cabinet installations planned for 2027 and access by paid membership whose price DOT has not stated, and Swobbee's own pilot has logged about 150,000 swaps (CleanTechnica, 2026-02-28). All of those networks are closed: the operator owns pack, cabinet and protocol. An open cabinet built to the SwapCell interface is the gap. No competitor publishes a cabinet or swap price, so the competitive price entries below are **to assess**, and nothing here is invented. Prices and benchmarks were checked 2026-10-31. Method: STANDARDS section 23.

Table 1. Market segments.

Segment	Target users and region	Competitive benchmark (cited price)	Estimated cost per unit (USD)	Value proposition
Delivery-worker groups and cooperatives	App-based delivery riders in dense cities, New York City first (DKH-DEC-001)	NYC DOT public network: membership, price not yet stated (2025-11-18); Swobbee station 30 slots, 500 swaps a day, subscription, "contact for pricing" (Levy Electric listing)	1,519 in parts with two bays fitted and the pad; 1,743 with four bays; packs excluded (bom/bom.csv)	An open cabinet a group can own and run, with packs not locked to one operator
Courier and cargo-trike fleets	Depots and loading zones	Gogoro GoStation 24 slots, 1,000 swaps a day capacity, subscription, "contact for pricing" (Levy Electric listing)	As above	Uptime without a second pack per vehicle; pack health data from the CAN log
Cities and fire departments	Plazas and sidewalks	Public network cabinets certified to applicable UL standards (NYC DOT, 2025-11-18); costs not stated	As above, plus certification (to assess)	An inspectable, documented design that replaces home charging
Emerging-market moto-taxi hubs	Informal transport hubs	Gogoro Network Flex plan, Taiwan, 2019 open beta: TWD 299 a month plus TWD 2.3 per Ah used	As above	Low-cost energy without owning the battery; a 2019 price in another market, shown only for scale

Running cost: the grid energy of a swap is about USD 0.09 at an assumed USD 0.20 per kWh (DKH-CAL-001 s5, 8.76 kWh for 20 swaps). Revenue, pack cost recovery (USD 414 per pack, three to four packs per station) and membership pricing are **to assess** with a partner.

The viability question is not physics, which DKH-CAL-001 closes on paper, but certification and pack supply. The cabinet is USD 319 over its USD 1,200 target and the fire certification route is unconfirmed (DKH-REG-001 G1), so the first viable route is a private-property pilot with a partner who owns the packs.

Open route

A sheet metal shop builds the cabinet from the drawings and build plan; a cooperative or fleet installs it on private land with an electrician; the SwapCell project supplies the packs and interface. CERN-OHL-S keeps changes open. The packs are the valuable part (USD 414 each), so the cabinet is the thing to share.
